

ABSTRACT

In a paver comprising a paving screed and at least one working component which is heated by means of at least one electric heating element H, e.g. a smoothing plate, the heating element H being secured in heat tampering condition at a heating area of the working component, the heating element containing at least one heating coil, the heating element is a plane heating element, the heating coil is a heating conductor which is wound in spirals around plane carrier material, and the peripheral form of the carrier material and/or the winding density or the winding course of the heating conductor is adapted to a predetermined heating picture in the heating area, respectively.
